PTY LTD

Falcon SB750 Concentrator Performance

The Greenfield's Mill is owned and operated as a Toll Gold Treatment Facility by Higginsville Mining Pty Ltd. We have a range of Clients that deliver ores for treatment that are extremely variable in nature, both in terms of grade and work index. We decided in late 2005 to update our existing Gravity circuit and looked very carefully at our options, after some deliberation it was decided to replace our existing Knelson Concentrator with a Falcon SB750 Concentrator; the reasons we chose this option was that based on available data, the various operating parameters were more suitable to our needs. These included less water usage, better bearing engineering on the bowl and a more rugged structure. After almost twelve months of operation, we are delighted to have chosen the Falcon because the ease of operation, all Falcon's claims were met and minimum maintenance; because of increased Gravity recovery we have also seen a significant reduction in reagent usage. The amount of free gold recovered on one particular ore has risen from 45% of total gold to 72%, while we have generally seen an overall average increase of around 48%. There has been no unplanned downtime, and the level of backup provided by Western Process's Brian Packer has been outstanding as has been from the people from Falcon. Based on all of the above, I would have absolutely no hesitation in recommending a Falcon SB750 and would install another if the need arose.
